

MMM Session Cycle Guide

This document explains the Market Maker Method (Steve Mauro) daily session cycle -- the core framework that drives every entry decision in Helix V3.

The Core Idea

Institutional market makers follow a predictable daily cycle to accumulate positions, trap retail traders with fake breakouts, then drive price in the real direction for profit. The session phases describe where we are in that cycle.

Daily Session Phases

Phase	UTC Time	Kenyan Time (EAT)	What Is Happening	Entry Quality
ACCUMULATION	01:00 - 05:00	04:00 - 08:00	Asia session. Price ranges tight. Market makers quietly build positions. The "Asian range" (box) forms here. Low volume, small candles.	NO ENTRY -- range is forming
STOP_HUNT	05:00 - 08:00	08:00 - 11:00	London pre-market / early London. Price BREAKS above or below the Asian range. This triggers retail stop losses. This is the FAKE move -- retail traders get stopped out, market makers fill their real orders at better prices.	BEST ENTRY WINDOW. Enter after the fake breakout reverses.
TRUE_TREND	08:00 - 13:00	11:00 - 16:00	London main session. After the fake stop hunt, price reverses and moves in the REAL direction. This is where profits run. The M/W pattern confirms the reversal.	GOOD for entries if you missed the stop hunt. This is where the real move happens.
NYC_REVERSAL	13:00 - 17:00	16:00 - 20:00	New York overlap. Late-day potential reversal. Can get a secondary entry here but it's less reliable than London. Often price retraces part of the London move.	SECONDARY window. Less reliable.
RETURN_TO_ACCUM	17:00 - 01:00	20:00 - 04:00	Session winding down. Price drifts back toward the center. Volume dies. Nothing useful happens here.	NO ENTRY -- dead time. System blocks all entries.

Visual: The Daily Price Cycle

How the Entry Actually Works

- Asian session (04:00-08:00 EAT):** Watch the range form. Note the High and Low.
- Stop hunt (08:00-11:00 EAT):** Price breaks ABOVE the Asian High (or BELOW the Asian Low). Retail traders think "breakout!" and go long (or short). Their stop losses are now exposed.
- The reversal:** Price reverses sharply. Those retail stops get hit. Market makers now have filled their real positions at the prices they wanted.
- Entry signal:** The system detects:
 - Asian range formed (accumulation valid)
 - Price broke the range (stop hunt detected, X pips of breach)
 - M/W pattern forming (W-bottom = BUY, M-top = SELL)
 - At least 3 pushes in the structure
 - TDI confirmation (momentum aligning)
- True trend (11:00-16:00 EAT):** Price moves in the real direction. Our trade is in profit. T1 partial close at 1:1 RR, then trail the stop.

The Weekly Cycle

The daily cycle sits inside a weekly cycle:

Weekly Phase	Days	Kenyan Reference	What's Happening
EARLY_WEEK	Sunday-Monday	Sun night - Mon	Cycle starts. First accumulation + stop hunt. Often the strongest setups.
MID_WEEK	Tuesday-Wednesday	Tue - Wed	Mid-week reversal zone. If early-week pushed one direction, the reversal often happens here. Wednesday accumulation on GBPJPY has 70.5% win rate.
LATE_WEEK	Thursday-Friday	Thu - Fri	Final push or exhaustion. Friday exits before weekend. Less reliable for new entries.

H4 Level Count

The H4 level count tracks how many "pushes" or legs the market has made on the 4-hour timeframe:

Level	Meaning	Entry Quality
L0	No clear structure yet	Neutral -- needs other confluence
L1	First push	Early in the cycle, good for with-trend entries
L2	Second push	Building momentum, still room to run
L3	Third push	Peak/reversal expected. This is where the best counter-trend setups form. All R_RUNNER setups are L3.

What R_RUNNER Setups Look Like

All 3 R_RUNNER setups share this exact profile:

THE_33_MW | BUY | EARLY_WEEK | L3 | STOP_HUNT

Translation in plain language:

- **THE_33_MW:** Pattern type "The 33" with M/W confirmation
- **BUY:** W-bottom pattern detected (the reversal signal)
- **EARLY_WEEK:** Monday (cycle just started)
- **L3:** H4 has made 3 pushes down (exhaustion)
- **STOP_HUNT:** London just broke below Asian Low (the fake move)

So the trade is: Market pushed down 3 times on H4, Asia accumulated, London broke below to stop out longs, then a W-bottom forms signaling the reversal. Enter BUY.

This happens on GBPJPY on Mondays during the 08:00-11:00 EAT window with 85-90% success rate.

Kenyan Time Quick Reference

For quick reference during live trading:

Time (EAT)	What To Do
04:00 - 08:00	Watch Asian range form. Note the box. Do NOT trade.
08:00 - 09:00	Watch for stop hunt. Price should break Asian H or L.
09:00 - 11:00	PRIME ENTRY WINDOW. If stop hunt + M/W + 3 pushes, the system enters.
11:00 - 16:00	Manage open trades. Still valid for new entries if conditions met.
16:00 - 20:00	NYC reversal. Secondary window only. Tighter targets.
20:00 - 04:00	DONE. Close anything not in profit. Wait for next day.

Filter Signals (from Codex Ablation Research)

These filters improve win rate when applied on top of the session cycle:

Filter	What It Checks	Effect
TDI RSI > Signal	Momentum already turning in entry direction	GBPJPY: 60% -> 100% win rate
Asian Range >= 30 pips	Accumulation was substantial, not just noise	EURJPY: 50% -> 75% win rate
Hunt within pair expected range	Stop hunt wasn't abnormally deep	GBPJPY true-trend: 64% -> 82% win rate

RRS Performance Grades

Grade	Favorable Rate	Meaning	Action
R_RUNNER	>= 75%	Elite setup. Historically wins 3 out of 4 times.	Highest conviction. Full risk allocation.
R_REPEATER	>= 50%, < 75%	Solid repeatable edge. Wins more than it loses.	Standard risk. The volume is here (90 setups).
S_STRANGER	< 50%	Loses more than it wins. Only interesting if payoff is asymmetric.	Watch only unless avg exit is strongly positive.
